Abstract Sampang Regency is located on Madura Island, which is included in the province of East Java. In this case, the city centre of the Sampang area was selected as the correct site for redesigning a bus terminal. Based on the results of the field survey and literature review, there was a problem with the inadequacy of the aesthetic appeal and facilities at the Sampang bus terminal. Therefore, it must be redesigned to improve the quality and quantity of services to the community and to gain convenience in terms of transportation, especially bus transportation. The research methods employed for redesigning this bus terminal involved several steps, namely observation, interviews, and documentation. The theme of tropical architecture applied as the macro concept of design produces a building that can adapt to the climate or nature. Meanwhile, the micro concept of effective land use maximizes the use of land so that the shape of the building can respond to the environment. It will become a tropical building that is able to adapt to the needs of users so that the spaces will be able to serve based on their functions. The redesign of the Sampang bus terminal is expected to be a public facility for transportation that is aesthetic and adequate, with better landscape governance.

Keywords: tropical architecture, B-typed terminal redesign, Trunojoyo bus terminal
